SUMMARY

Flutter engineer with 6+ years of experience who went from mobile development in teams to solo founder building and operating a production SaaS end-to-end: mobile + web + backend + ML + payments + growth + infrastructure. Deep expertise in AI-native engineering — workflows where one engineer with AI agents ships the output of a 4–6 person team. In my spare time, I run a lifestyle blog, play chess and basketball, learn Castilian Spanish in Argentina, and spend time with my loved ones. ***I even have a cat*** *— giving the Argentine cat the name Vaska was my neighbor Claudio's idea* 👉👈

PROFESSIONAL EXPERIENCE

UX Expert - Software - Mercado Pago — Jul 2025 - present | MercadoLibre, Inc., Buenos Aires

Comercio electrónico y fintech en América Latina

Design and development of Mercado Pago payment and profile flows: from user flows and Figma prototypes to design-system components in production. Internal tools for sellers and a logistics app for couriers.

– company: 80,000+ employees, e-commerce and fintech across 18 Latin American countries

- designed UX and interaction design and turned the decisions into stable production code myself: design-system components in HTML, CSS, TypeScript, React and Flutter, design tokens, loading, error and offline states
- kept accessibility (contrast, focus, screen readers) and performance as acceptance criteria; fixed design-to-code mismatches, component regressions and crashes surfaced by Firebase Crashlytics
- brought generative AI into the design → code loop: interface variants from design tokens, AI review of layouts against the design and accessibility rules, generated UI tests
- built, configured and evaluated agentic workflows — context, tools, instructions and safety boundaries — for seller tools
- released production updates via CI/CD

Stack: HTML · CSS · JavaScript · TypeScript · React · Flutter · Dart · Figma · Design Systems · Design Tokens · WCAG · Firebase Crashlytics · CI/CD · Claude Code · MCP

Co-Founder / Lead Engineer — Jul 2026 - present | 20mm, Moscow, Remote

Estimating CRM for stone fabrication: from a designer's drawing to quote, slab nesting, workshop and sign-off

A manager gets a quote with slab nesting in minutes instead of hours: drawing (PDF, photo, scan, DXF) → parts → seams → nesting → services and price → quote, contract and a guest link for the client. 1,670-item stone catalog, workshop screen, mobile sign-off with the client's signature. Beta 1.0 in Flutter, version 2.0 in Next.js. 20-mm.ru

– team: 1 engineer + AI agents

– company: turnkey stone interiors for Moscow design studios, 7–9M RUB monthly revenue

- designed the AI boundaries: the model only reads drawings and phrases text, money is computed by a deterministic engine — the number on a quote is the same on every run
- model boundaries are enforced in code, not in the prompt: topic check before the call, timeout, schema validation of the answer, fallback to rules, a monthly AI spending cap
- server-side drawing reading (Gemini), an assistant that edits the estimate from text and voice (DeepSeek), an MCP server through which Claude sends part lists into the estimate with a personal key
- validated the engine against the manager's manual estimates on real orders; 150+ Playwright scenarios follow the same path a user takes on screen
- one design system for web and Flutter generated from a single token file (Apple HIG, Liquid Glass), light and dark schemes; UI in 14 languages
- infrastructure: prod and staging on a Moscow server (Docker Compose, nginx, Let's Encrypt), egress to foreign AI APIs over Tailscale, nightly backups with tested restore; handled a security incident, rotated keys and added monitoring

Stack: Next.js · React · TypeScript · Tailwind · Three.js · Zod · next-intl · PostgreSQL · Go · Flutter · Docker Compose · nginx · Tailscale · Cloudflare · Playwright · MCP · Gemini · DeepSeek · Claude

Flutter Developer (Founder) — Apr 2026 - present | Greentext AI Inc., Argentina–USA, Remote

AI Text Humanizer & Detector

My own SaaS with paying users: researched the market, incorporated in Delaware, built the whole product and run growth. One Flutter app covers Web, iOS and Android. greentext.ai

– team: 1 engineer + AI agents

– company: Greentext AI Inc., Delaware C-corp

- built the Flutter app (Web, iOS, Android) with auth, subscription tiers and admin panel, and the Go backend (REST API, PostgreSQL, Redis)
- trained a custom ML detector (fine-tuned RoBERTa) that outperforms competitors like Sapling and Winston
- set up Stripe billing: subscriptions, metered overage, webhooks, idempotency
- closed anti-abuse and fingerprinting gaps and attribution mismatches between ad clicks and purchases; kept staging/prod reliable

Stack: Flutter · Dart · Go · PostgreSQL · Redis · Next.js · PyTorch · RoBERTa · Stripe · AWS · Docker · GitHub Actions · Cloudflare · Sentry · GA4 · GTM

Lead Mobile Developer — Oct 2025 - Jun 2026 | Greentext AI Inc., USA, Remote · Walter Writes AI project

AI text humanizer & detector for Walter IA Inc. (USA), iOS and Android, $1.2M MRR

Humanizer and AI-detector mobile apps for a US client: history with offline cache, 10 UI languages, sign-in with email, Google, Facebook and Apple, Apple/Google subscriptions with server-side verification. App Store · Google Play

– team: 3 Flutter developers, hired and led

– client: Walter IA Inc., USA

- hired the team, owned architecture, code review and the release cycle on the App Store and Google Play
- set up a test-driven loop with the AI agent following Anthropic's guidance: tests from the OpenAPI contract come first, the agent confirms they fail, and only then writes the implementation until they pass
- unit and bloc tests on models, services and every feature — a verification layer the agent can't talk its way around; Apple IAP and Walter API references live in the repo as agent context
- closed subscription edge cases: purchase restore, duplicate Apple webhooks, plan status drift
- separated preprod/staging/prod and moved secrets out of the repository — the agent never sees production keys; wrote tools that find unused assets and localization keys

Stack: Flutter · Dart · Bloc · GoRouter · Dio · Hive · In-App Purchase · Firebase Crashlytics · Firebase Analytics · Google / Facebook / Apple Sign-In · Cloudflare Turnstile · OpenAPI · Mockito · bloc_test · Claude Code

Flutter Developer — Jan 2026 - Jun 2026 | Greentext AI Inc., USA, Remote · Erlesen project

Erlesen — Kurzgeschichten: short-story reader for the German market, iOS and Android

Short-story reading with progress and focus mode, audio versions with background playback, bookmarks, favorites, author pages, offline library, subscriptions and an early-bird trial. App Store

– team: 2 Flutter developers

– company: Greentext AI Inc.

- set up context engineering for the AI agent: project rules in CLAUDE.md plus a code knowledge graph over MCP — the agent first checks the blast radius of a change, affected flows and test coverage, then edits
- worked in an explore → plan → code → verify loop; every diff gets a separate risk-scored review before I accept it
- fixed reading progress lost between sessions and devices, background audio failures, subscription status drift after purchase
- published releases and updates

Stack: Flutter · Dart · Bloc · GoRouter · Drift · Firebase Auth · Firestore · Remote Config · FCM · RevenueCat · just_audio · audio_service · Airtable · gen-l10n · MCP · Claude Code

Flutter Developer — Mar 2025 - Jun 2026 | Greentext AI Inc., USA, Remote · JewBuzz Love project

Dating app for the Jewish community, iOS and Android; tens of thousands of MAU, expanding into LATAM

Dating with real-time chats, discovery modes (map, roulette, blind date), likes and favorites, in-app purchases, deep links, push notifications and geolocation. Google Play

– team: 2 Flutter developers
– company: Greentext AI Inc.

- used AI agents on a large codebase I didn't write: read-only exploration and a plan first, changes in small PRs through the team's regular review
- orchestrator-workers pattern: parallel subagents per module; an automated gate (flutter analyze, builds of every flavor) before a human sees the change
- maintained dev/preprod/prod builds with separate Firebase projects
- fixed messages lost on socket reconnect, duplicate push notifications, crashes surfaced by Firebase Crashlytics

Stack: Flutter · Dart · Bloc · GoRouter · Dio · Amity SDK · Socket.IO · MQTT · Pusher · Firebase Messaging · Crashlytics · Google Maps · In-App Purchase · Amplitude · Customer.io · easy_localization · Claude Code

Flutter Developer — Oct 2025 - Jan 2026 | Greentext AI Inc., USA, Remote · AI Cleaner project

AI Clean Up — photo library cleaning utility for iOS

Finds similar and blurry photos, duplicates and bursts, Live Photos, screen recordings and large videos; swipe review mode, subscriptions. App Store

– team: 1 developer + AI agent
– company: Greentext AI Inc.

- spec-driven development: the tech spec and phases are the AI agent's contract; the agent commits under its own git author (46 of 72 commits), so every change it makes is traceable and revertible
- accepted each phase against a Vision testing checklist on a real device; store publishing is done by a human only
- implemented perceptual hashing (DCT) for similar photos and Laplacian variance + Apple Vision for blurry ones
- built native iOS 26 components via Platform Views and a Swift bridge on Pigeon
- sped up scanning of large libraries (background processing with pause and resume), removed memory growth on thumbnails

Stack: Flutter · Dart · Swift · Pigeon · Platform Views · Apple Vision · photo_manager · Bloc · hydrated_bloc · get_it · injectable · freezed · auto_route · Apphud · AppsFlyer · ATT · Claude Code

Flutter Developer — Sep 2024 - Jul 2025 | Grand Mobile (Dynamic Technologies), Argentina, Remote

Mobile role-playing game, life simulator, 4M MAU

Ported the iOS version of the game from Java to Flutter in 10 months: 30+ interfaces from Figma designs and client logic for 40+ game modules. Available on the App Store.

– team: 50+ people

- developed 30+ interfaces from scratch based on Figma designs, delivered new gameplay features daily
- connected the app to the C++ backend (RakNet::BitStream, RPC)
- fixed broken UI elements, game state desync, unstable network operations

Stack: Flutter · Dart · Bloc · Dio · Retrofit · Clean Architecture · GoRouter · C++ backend · RakNet BitStream · RPC · PAWN · Figma

Flutter Developer — Feb 2024 - Feb 2025 | TN-GROUP LLC, Europe, Remote

ERP system for equipment field service

Supported 4 clients with apps built on top of the core ERP-Aurora application. Launched a WebView browser for convenient sign-in to the group companies' accounts.

– team: 2 Flutter developers
– company: 20+ employees

- wrote technical specifications and aligned them with backend developers
- built new features offline-first, keeping the app fully functional on legacy Android devices
- published releases and updates

Stack: Git · Bloc · cubit · mobx · SQLite · Drift · Hive · Injectable, get_it · REST API, Swagger · Postman · App Store Review Guidelines · Provisioning Profiles & Certificates

Flutter Developer — May 2023 - Nov 2024 | Dolinger Web, Kazakhstan, Remote

White-label shop apps with ordering and order tracking: 65 clients, 20k+ users, 5–10K MAU

Maintained 70+ client apps on a shared platform: weekly delivery schedule in the profile, new product and category views, rewritten theme switching, migration from Yandex Maps to Google Maps.

– company: Dolinger Web, Kazakhstan

- integrated payment and maps SDKs, Firebase Messaging, deep links
- completely rewrote theme switching, replaced Yandex Maps with Google Maps
- fixed broken product search, set up Crashlytics
- introduced a Contribution Guide and Gitflow; published releases to the App Store and Google Play

Stack: Flutter · Dart · REST API · Firebase Messaging · Crashlytics · Google Maps · Yandex Maps · Deep Links · Gitflow · App Store / Google Play

AI-NATIVE ENGINEERING (2025–2026)

1. Agentic development (Claude Code & similar): full-context task briefs, autonomous multi-hour sessions, parallel agents, overnight ML training runs with checkpoints and control protocols.
2. Persistent memory & protocols: file-based memory systems, codeword pipelines, “lessons learned” as executable rules (secret-rotation order, honest-testing protocols, deploy checklists). • Autonomous verification: agents build the app, run Playwright scenarios, verify API/DB/payments end-to-end before reporting.
3. AI-safety mindset in prod: privilege separation (agents never commit/deploy), single sources of truth (prices/limits in DB, not code), contract tests against front↔back drift.
4. LLM engineering: transformer fine-tuning (MPS/GPU), adversarial datasets, ensembles & calibration, cost engineering of external AI APIs.
5. A trust ladder for agents (after Anthropic’s “Building Effective Agents”): I start with the simplest thing — a single model call or a workflow (prompt chaining, routing, evaluator-optimizer) — and grant agent autonomy only when the simple version falls short; trust expands as verification layers pass: tests, linters, a separate reviewer agent, hooks, manual acceptance. I design agent tools as an interface (agent-computer interface), permissions via allowlist, and irreversible actions go through a human only.

PROFESSIONAL DEVELOPMENT / AFFILIATIONS

1. Open source: IT Solutions Management International Pte. Ltd. (Singapore) — Gapopa messenger: github.com/team113/messenger
2. Kaif Games FZCO (Dubai) — mobile game Rus RP: developed and integrated 12 interfaces. Laskino Park Residential Complex — iOS app for property management and residents; part of a 3-person team; published on the App Store with access control and sports facilities booking.
3. Toxicity — set up and implemented analytics, designed the app architecture.
4. Athina Plus (Kazakhstan) — web studio; developed multiple websites.
5. LLC VIBE GAMES (Kazakhstan) — mobile game MATRESHKA RP: developed and integrated 3 complex interfaces, for example: petrfalkovsky.github.io/vibe_games
