SUMMARY

Flutter engineer with 6+ years of experience who went from mobile development in teams to solo founder building and operating a production SaaS end-to-end: mobile + web + backend + ML + payments + growth + infrastructure. Deep expertise in AI-native engineering — workflows where one engineer with AI agents ships the output of a 4–6 person team. In my spare time, I run a lifestyle blog, play chess and basketball, learn Castilian Spanish in Argentina, and spend time with my loved ones. ***I even have a cat*** *— giving the Argentine cat the name Vaska was my neighbor Claudio's idea* 👉👈

PROFESSIONAL EXPERIENCE

UX Expert - Software - Mercado Pago — Jul 2025 - present | MercadoLibre, Inc., Buenos Aires

Comercio electrónico y fintech en América Latina

- Implemented the following new features: designed the UX and interaction design of Mercado Pago payment and profile flows and turned them into stable production code myself: from user flows and Figma prototypes to design-system components in HTML, CSS, TypeScript and component frameworks (React, Flutter); design tokens, loading and error states, offline support, with accessibility (contrast, focus, screen readers) and performance as acceptance criteria.
- Fixed such bugs: mismatches between design and code, design-system component regressions, accessibility and rendering-speed issues, unstable network flows and incorrect state synchronization surfaced by Firebase Crashlytics; released production updates via CI/CD.
- GenAI & agentic workflows: brought generative AI into the design → code loop: generating interface variants from design-system tokens, AI review of layouts against the design and accessibility rules, generating UI tests. Built, configured and evaluated agentic workflows — context, tools, instructions and safety boundaries — for internal seller tools and the courier logistics app.

Flutter Developer (Founder) — Apr 2026 - present | Greentext AI Inc., Argentina–USA, Remote

AI Text Humanizer & Detector

- Implemented the following new features: built the product end-to-end: developed the Flutter app (Web, iOS, Android) with auth, subscription tiers, and admin panel; built the Go backend (REST API, PostgreSQL, Redis); trained a custom ML detector (fine-tuned RoBERTa) that outperforms competitors like Sapling and Winston.
- Fixed such bugs: anti-abuse and fingerprinting gaps, billing edge cases (Stripe webhooks, metered overage), attribution mismatches between ad clicks and purchases, and infra reliability across staging/prod deploys.
- Try the app at greentext.ai

Lead Mobile Developer — Oct 2025 - Jun 2026 | Greentext AI Inc., USA, Remote · Walter Writes AI project

AI text humanizer & detector for Walter IA Inc. (USA), iOS and Android, $1.2M MRR

- Implemented the following new features: hired and led the team, owned architecture and code review; Flutter apps for iOS and Android: humanizer, AI detector with per-fragment scoring, history with offline cache (Hive), 10 UI languages, sign-in with email, Google, Facebook and Apple, Apple/Google In-App Purchase subscriptions with server-side verification, Cloudflare Turnstile, support chat; release cycle on the App Store and Google Play.
- Fixed such bugs: subscription edge cases (purchase restore, duplicate Apple webhooks, plan status drift), unused assets and localization keys (wrote checker tools), preprod/staging/prod environment mix-ups — secrets moved out of the repository.
- AI-assisted development: test-driven loop with the agent, following Anthropic's guidance: tests first from the OpenAPI contract, the agent confirms they fail, and only then writes the implementation until they pass; unit and bloc tests on models, services and every feature as a verification layer the agent can't talk its way around; references (Apple IAP, Walter API) live in the repo as agent context instead of guesswork; the agent never sees production keys. App Store · Google Play

Flutter Developer — Jan 2026 - Jun 2026 | Greentext AI Inc., USA, Remote · Erlesen project

Erlesen — Kurzgeschichten: short-story reader for the German market, iOS and Android

- Implemented the following new features: reading mode with progress and focus mode, audio versions with background playback, bookmarks and favorites, author pages, offline library (Drift), subscriptions and early-bird trial (RevenueCat), donations, Firebase Auth, Firestore, Remote Config and push notifications, deep links, feedback form, localization.
- Fixed such bugs: reading progress lost between sessions and devices, background audio failures, subscription status drift after purchase, layout issues on small screens.
- AI-assisted development: context engineering: a CLAUDE.md with project rules plus a code knowledge graph over MCP — the agent first checks the blast radius of a change, affected flows and test coverage, then edits; explore → plan → code → verify loop; every diff gets a separate risk-scored review before I accept it. App Store

Flutter Developer — Oct 2025 - Jan 2026 | Greentext AI Inc., USA, Remote · AI Cleaner project

AI Clean Up — photo library cleaning utility for iOS

- Implemented the following new features: detection of similar photos (perceptual hash, DCT), blurry ones (Laplacian variance + Apple Vision), duplicates and bursts, Live Photos, screen recordings and large videos; native iOS 26 components via Platform Views and a Swift bridge on Pigeon; swipe review mode; subscriptions (Apphud), attribution (AppsFlyer), App Tracking Transparency.
- Fixed such bugs: slow scanning of large libraries (background processing with pause and resume), growing memory on thumbnails, false matches among similar photos.
- AI-assisted development: spec-driven approach: the technical specification and development phases are the agent's contract; the agent commits under its own git author (46 of 72 commits), so every change it makes is traceable and revertible; I accept each phase against a Vision testing checklist on a real device; store publishing is done by a human only. App Store

Flutter Developer — Mar 2025 - Jun 2026 | Greentext AI Inc., USA, Remote · JewBuzz Love project

Dating app for the Jewish community, iOS and Android; tens of thousands of MAU, expanding into LATAM

- Implemented the following new features: as part of the team: real-time chats (Amity SDK, Socket.IO, MQTT, Pusher), discovery modes (map, roulette, blind date), likes and favorites, in-app purchases, deep links, push notifications, geolocation, dev/preprod/prod builds with separate Firebase projects, analytics (Amplitude, Customer.io).
- Fixed such bugs: messages lost on socket reconnect, duplicate push notifications, crashes surfaced by Firebase Crashlytics, drift between environments.
- AI-assisted development: agents on a large codebase I didn't write: read-only exploration and a plan first, changes in small PRs through the team's regular review; orchestrator-workers pattern with parallel subagents per module; an automated gate (flutter analyze, builds of every flavor) before a human ever sees the change. Google Play

Flutter Developer — Sep 2024 - Jul 2025 | Grand Mobile (Dynamic Technologies), Argentina, Remote, 4M MAU

Mobile role-playing game, life simulator

- Implemented the following new features: developed more than 30 unique user interfaces from scratch based on Figma designs, connected the application to the backend, wrote client-side logic for more than 40 different game modules, and delivered new gameplay features on a daily basis.
- Fixed such bugs: broken UI elements, incorrect game state synchronization, unstable network operations, and numerous minor gameplay issues.
- Download the app from the stores for iOS.

Flutter Developer — Feb 2024 - Feb 2025 | TN-GROUP, Europe, Remote, 30–70 MAU

B2B, Field Service Management (FSM): field service management and quality control system in the agro-industrial sector

- Implemented the following new features: added new fields saved in local storage; fixed fast battery drain on old Android devices when checking the Internet connection, crashes when sending a file to the server, and many, many other bugs on a daily basis.
- Fixed such bugs: incomplete search results for more than 15k rows in the database, slow search, unpredictable behavior of the application in offline mode.
- Download the app from the stores for Android and iOS.

Flutter Developer — May 2023 - Nov 2024 | Dolinger Web, Kazakhstan, Remote, 5–10K MAU

Commercial shop apps with ordering and order tracking: 65 clients and more than 20k users

- Implemented the following new features: weekly delivery schedule in the profile, a new product view with lunchtime visibility, a new category view, a complete rewrite of theme switching, replaced Yandex Maps with Google Maps.
- Fixed such bugs: product search not working, search bug with Yandex Maps (Crashlytics installation).

AI-NATIVE ENGINEERING (2025–2026)

1. Agentic development (Claude Code & similar): full-context task briefs, autonomous multi-hour sessions, parallel agents, overnight ML training runs with checkpoints and control protocols.
2. Persistent memory & protocols: file-based memory systems, codeword pipelines, “lessons learned” as executable rules (secret-rotation order, honest-testing protocols, deploy checklists). • Autonomous verification: agents build the app, run Playwright scenarios, verify API/DB/payments end-to-end before reporting.
3. AI-safety mindset in prod: privilege separation (agents never commit/deploy), single sources of truth (prices/limits in DB, not code), contract tests against front↔back drift.
4. LLM engineering: transformer fine-tuning (MPS/GPU), adversarial datasets, ensembles & calibration, cost engineering of external AI APIs.
5. A trust ladder for agents (after Anthropic’s “Building Effective Agents”): I start with the simplest thing — a single model call or a workflow (prompt chaining, routing, evaluator-optimizer) — and grant agent autonomy only when the simple version falls short; trust expands as verification layers pass: tests, linters, a separate reviewer agent, hooks, manual acceptance. I design agent tools as an interface (agent-computer interface), permissions via allowlist, and irreversible actions go through a human only.

PROFESSIONAL DEVELOPMENT / AFFILIATIONS

1. Open source: IT Solutions Management International Pte. Ltd. (Singapore) — Gapopa messenger: github.com/team113/messenger
2. Kaif Games FZCO (Dubai) — mobile game Rus RP: developed and integrated 12 interfaces. Laskino Park Residential Complex — iOS app for property management and residents; part of a 3-person team; published on the App Store with access control and sports facilities booking.
3. Toxicity — set up and implemented analytics, designed the app architecture.
4. Athina Plus (Kazakhstan) — web studio; developed multiple websites.
5. LLC VIBE GAMES (Kazakhstan) — mobile game MATRESHKA RP: developed and integrated 3 complex interfaces, for example: petrfalkovsky.github.io/vibe_games
